International symposium on macromolecular chemistry. Moscow, 1960.

Mezhdunarodnyy simpozium po makromolekulyarnoy khimii SSSR, Moskva, 14-18 iyunya 1960 g.; doklady i avtoreferaty. Sest'ya III. (International Symposium on Macromolecular Chemistry Held in Moscow, June 14-18, 1960; Papers and Summaries) Section III. (Moscow, Izd-vo AN SSSR, 1960) 469 p. 55,000 copies printed.

Tech. Ed.: P. S. Kashina.

Sponsoring Agency: The International Union of Pure and Applied Chemistry. Commission on Macromolecular Chemistry.

PURPOSE: This book is intended for chemists interested in polymerization reactions and the synthesis of high molecular compounds.

COVERAGE: This is Section III of a multivolume work containing papers on macromolecular chemistry. The articles in general deal with the kinetics of polymerization reactions, the synthesis of special-purpose polymers, etc., and exchange resins, semiconductor materials, etc., and catalyzing polymerization reactions, properties, and chemical interactions of high molecular materials, and the effects of various factors on polymerization and the degradation of high molecular compounds. No personalities are mentioned. References given follow the articles.

"The Effect of Vitamin E Administration on the Cholinesterase Activity of the Serum and the Erythrocytes."

Budapest, Kiserletes Orvostudomány, Vol XV, No 4, Aug 1963, pages 355-361.

Abstract: [Authors' Hungarian summary] The effect of large doses of vitamin E, on rats, in the presence of various cholinesterase inhibitors, has been investigated by the authors. It was found that: 1. by prolonged administration of vitamin E, along with TOCP, DFP, Wofatox (methylparathion) or Prostigmin, the cholinesterase inhibitory effect of these compounds is greatly reduced; 2. this reduction of inhibition is apparent in the cholinesterase activity of both the erythrocytes and the serum; 3. in cases of acute Wofatox poisoning, large amounts of vitamin E, taken beforehand, provide partial defense; 4. the alkaline phosphatase activity of heart muscle homogenates of normal rats is increased after the administration of vitamin E. 8 Western, 8 Eastern European references.

TITLE: Approximate solution by Yu. D. Solokov's method of integral equations with a lagging independent variable

SOURCE: Ukrainskiy matematicheskiy zhurnal, v. 18, no. 6, 1966, 102-107

TOPIC TAGS: integral equation, Legendre polynomial, approximate solution, successive approximation, approximation error, complex function, mathematic space, approximation convergence

ABSTRACT: This paper extends one of A. Yu. Luchka's algorithms (A. Yu. Luchka. Teoriya i primeneniye metoda osredneniya funktsional'nykh popravok, Izd-vo. AN UkrSSR, K., 1963) to the case of integral equations with a lagging independent variable. The following equation in the space  $L^p$  is examined:

$$y(x) = f(x) + \lambda \int_a^b K(x, \xi) y(\xi - \Delta(\xi)) d\xi,$$

where  $\lambda$  is a regular value, the interval  $(a, b)$  is finite, the complex-valued functions  $f(x)$ ,  $K(x, \xi)$  of the real variables  $x$ ,  $\xi$  are assigned in the domains  $\sqrt{a - \tau_0}$ ,  $\sqrt{b}$ ,  $a \leq x$ ,  $\xi \leq b$ , respectively, and satisfy the conditions:

Card 1/2

ACC NR: AP6036159

$$\left\{ \int_a^b \left[ \int_a^b |K(x - \Delta(x), \xi)|^q d\xi \right]^{\frac{p}{q}} dx \right\}^{\frac{1}{p}} < \infty,$$

$$\left\{ \int_a^b |f(x - \Delta(x))|^p dx \right\}^{\frac{1}{p}} < \infty \quad \left( \frac{1}{p} + \frac{1}{q} = 1 \right),$$

$$\int_a^b |f(x - \Delta(x))| dx < \infty, \quad \int_a^b \text{vrai max}_\xi |K(x - \Delta(x), \xi)| dx < \infty \quad (p=1, q=\infty),$$

$$\text{vrai max}_x |f(x - \Delta(x))| < \infty, \quad \text{vrai max}_x \int_a^b |K(x - \Delta(x), \xi)| d\xi < \infty$$

$$(p = \infty, q = 1).$$

Here  $\Delta(x) \leq \tau_0$  (the particular case is not excluded), and  $\Delta(x)$  is a continuous function, wherein  $\Delta'(\sigma(x)) \neq 1$ , and  $\sigma(x)$  is the inverse of

$$F(x) = x - \Delta(x), \quad K(x - \Delta(x), \xi) \equiv 0 \quad \text{for } (x - \Delta(x)) \notin [a, b].$$

The convergence of the process of successive approximations is proved, and the error is estimated. An example calculation is given. Orig. art. has: 39 formulas and 1 table.

AUTHOR: Gal, Olga (Eng., Higher Professional Associate);  
Josić, Ljubica (Dipl. Phys. Chem. Assistant)

TITLE: Chemical dosimetry of high reactor radiation doses. Report to the Tenth Consultative Meeting of Chemists of People's Republic of Serbia held in Belgrade in January of 1963

SOURCE: Tehnika, no. 6, 1963, 1016-1021

TOPIC TAGS: dosimetry, oxalic acid dosimeter, reactor radiation, radiation chemical effect

ABSTRACT: The authors survey various kinds of primary and induced radiation in different working parts of a reactor and point out the difficulties in the theoretical and experimental determination of radiation doses. Among chemical dosimeters they preferred from the point of view of simplicity and reliability, the dosimeter made of aqueous solution of oxalic acid. The oxalic acid decomposes into carbon dioxide and water and the dose is determined by the disappearance of the oxalate ion. The dosimeter was developed in the Boris Kidric Institute

L 18284-63

ACCESSION NR: AP3001950

and initial measurements were made in the graphite columns of French reactors. The present work was carried out in the 6.5 Mw reactor RA in Vinca and the article contains curves of absorbed radiations within various columns of the reactor. The upper limit of the measured absorbed radiation is  $1.6 \times 10^8$  rad. The number of charges is determined by simple analytic procedure, and reactor radiations fail to induce radioactivity in the dosimeter material (C, O, and H). The yield due to radiation-chemical effects was determined by comparison with simultaneous calorimetric measurements of the total absorbed energy. Fig. 6 of Enclosure 1 shows good agreement of parallel chemical and calorimetric radiation measurements of the reactor. The oxalic dosimeter measurements also show good reproducibility. The authors attempted to increase the maximum possible measured dose by using solid oxalic acid. This would also reduce the amount of gases due to the radiolysis of water. Preliminary results are given in Fig. 9 of Enclosure 2. Further increases in acceptable doses should be possible by using ammonium oxalate which was found to decompose up to 100 times more slowly than oxalic acid. The use of lithium oxalate is planned for the thermal column of the reactor since the  ${}^6\text{Li}$  ( $n, \alpha$ ) T nuclear reaction could measure the total thermal neutron flux. The

Card 2/53

main problem during the use of solid oxalic acid was its thermal decomposition at a relatively low temperature (185° C). Orig. art. has 9 figures.

✓ 830. Influence of temperature on the extraction of uranyl nitrate with uranyl phosphate at varying concentrations of nitric acid. ~~See also 6460.4~~  
 Gal and L. K. Rajurain (Inst. Nucl. Sci., Belgrade). Bull. Inst. Nucl. Sci., Belgrade, 1957, 7, 43-44 (in English).—In the system (aq.  $\text{HNO}_3$ , 40%)–uranyl phosphate (diluted with dibutyl ether), the distribution coeff. ( $f$ ) of  $\text{UO}_2(\text{NO}_3)_2$  decreases with increasing temp. ( $T = 1^\circ$  to  $80^\circ$ ) at all concn. of  $\text{HNO}_3$ , up to 10 M, but for a specific concn. of  $\text{HNO}_3$ ,  $f$  is proportional to  $\log T$ . As indicated by the changes in vol. and optical transmission, and by the decrease in acidity of the aq. phase, the degree of chemical reaction between the two phases increases with  $T$  and acid concn. The limit of stability is 6 M  $\text{HNO}_3$  at  $20^\circ$  and 4 M  $\text{HNO}_3$  at  $80^\circ$ . At  $20^\circ$  the optimum acid concn. for the formation of the uranyl dinitrato complex is 6 M.

W. J. RANKIN

27  
Effect of diluents on the extraction of uranyl nitrate with  
tributyl phosphate. Zdenko I. Dizdar, Jelena K. Rain-  
vujn, and Olga S. Gal. Bull. Inst. Nuclear Sci. "Boris-  
Kidrich" (Belgrade) 8, 59-66(1958).—At lower concns. of  
U ( $\leq 150$  g./l.), the extn. of uranyl nitrate with tributyl  
phosphate (1) depends very much on the nature of diluents  
used. The greatest extn. occurs with 1 dild. with  $\text{CCl}_4$ .  
The distribution coeffs. decrease in the solvents in the order  
 $\text{CCl}_4$ , xylene, kerosine, hexane,  $\text{Bu}_2\text{O}$ ,  $\text{Et}_2\text{O}$ , and  $\text{iso-Pr}_2\text{O}$ .  
At greater U concns. these differences disappear.

908. SIMULTANEOUS OCCURRENCE OF PAGET'S DISEASE OF THE SKULL AND BRAIN TUMOR - Gal P. Nat. Neurosurg. Res. Inst., Budapest - J. NERV. MENT. DIS. 1957, 125/4 (574-577) Illus. 6

The case is reported of a 50-year-old woman who had complained of severe headaches over the right side of the head for 9 months, and in the last 6 months had developed slowness in thinking and an unsteady gait. Urinary incontinence had been present for 10 days. On the left side there was spastic hemiparesis, hemihypaesthesia and forced grasping. The patient swayed to the left. Mental examination revealed disorientation for time, memory defects, inconsistent attention, psychomotor retardation and flattening of mood. Roentgenograms revealed changes consistent with Paget's disease in the skull and angiography showed a circumscribed shadow of increased vascularity in the right fronto-temporal area. Right fronto-temporal craniotomy confirmed the presence of a neoplasm which was histologically considered a malignant glioma. The histological changes in the skull were typical of Paget's disease. In addition to Paget's disease, the skull showed asymptomatic basal impression. The occurrence of brain tumour in Paget's disease is rare, but should be looked for if there are signs of a space-occupying lesion.

1450. **Mental symptoms in cases of tumor of temporal lobe** GAL P. Nat. Neurosurg. Res. Inst., Budapest *Amer. J. Psychiat.* 1958, 115/2 (157-160)

In this series of 61 temporal lobe tumours there were mental symptoms in 50 cases. As initial symptoms there were mental manifestations in 37 cases before any neurological signs appeared. The symptoms were as follows: (1) fits (hallucinations, visual illusions, dreamy state, automatism, psychomotor equivalent, temporal epilepsy), (2) changes in personality, (3) disorders of mood, (4) schiziform psychosis, (5) parietal mental symptoms, (6) psycho-organic syndrome.

Polarographic and electrophoretic examination of milk serum proteins. T. Gál (Výzk. ústav pro mléč. v Praze, Prague). *Průmysl. Zprávy*, 5, 162-3, 200-1 (1941).  
Milk was centrifuged until the fat content was reduced to 0.1% and acid, with NaCl at 0.1% and the clear serum which sepd. was dialyzed. Casein interfered with the catalytic electrode reaction and had to be removed. The dependence of the height of the waves on the protein concn. in buffered Co solns. did not agree with Stricks and Kolbalt (C.A. 45, 80384). Contrary to their findings, the height of the wave did not change with time. The protein double wave did not depend on the pH, but the wave of the sulfosulphonic acid filtrates was descending from pH about 10 and the characteristics of the curve were the same as that of the dissociation curve of weak acids. Digestion of the serum caused the protein double wave to raise slightly and the filtrate wave to sink slightly. Urea did not influence the height of the protein double wave. Ultraviolet irradiation rapidly produced a ppt. in the serum, and the height of the double wave fell with time. In pasteurized milk, electrophoretic mobilities of individual constituents were increased and the relative compn. of the proteins was changed; as the concn. of the euglobulin increased the concn. of the pseudoglobulin decreased. The influence of temp. on the serum proteins was shown polarographically around 70° when the electrophoretic mobility showed a sharp rise. L. J. U.

TITLE: Investigation of temperature control conditions in the precipitation-  
sedimentation process in the Bayer-type alumina manufacture

SOURCE: Kohaszati lapok, v. 98, no. 7, 1965, 318-323

TOPIC TAGS: alumina, chemical precipitation, sedimentation separation, temperature control

ABSTRACT: The decomposition of sodium aluminate and the precipitation of alumina crystals in Bayer-type alumina manufacture were investigated with special emphasis on the temperature conditions. An equation was derived for the characterization of the relation between factory temperature and the temperature of the aluminate liquor in the Korting cooler. It was found that the refinement of the aluminate particle size can be conveniently determined by a filtration-resistance test. Studies were conducted to prevent the periodically occurring particle-size decrease. These studies showed that temperature control is one of the most suitable means for the elimination of this phenomenon. Orig. art. has: 8 figures and 2 tables. [JPRS]
